

Churnflix: Bank Churn Prediction App

This presentation will introduce Churnflix, a machine learning powered application designed to predict and mitigate customer churn for financial institutions.

Churnflix

AI details matat gefiecls
perference'ont cuistomen
seteriiganor, rescarn.

Key Features

Modern UI

Netflix-inspired dark-themed interface for user-friendliness

Predictive Analytics

AI-driven customer churn prediction using XGBoost

Custom Reports

Dynamic reports for analyzing business insights

FastAPI Backend

Efficient backend for handling ML predictions

How It Works

1

Step 1: User Input

The user provides key financial details (e.g., Credit Score, Age, Balance)

2

Step 2: Model Prediction

The backend processes the input using a trained XGBoost model

3

Step 3: Churn Forecast

The system predicts whether the customer is likely to churn

4

Step 4: Feature Importance

XGBoost explains which features had the most impact

Business Impact

Reduce Customer Loss

Identify at-risk customers early to minimize churn

Increase Retention

Enable personalized marketing campaigns & offers

Explainable AI

Use XGBoost feature importance to understand churn drivers

Customer Distribution and Churn Analysis

Customer Retention

The majority of customers (80%) remained with the bank.

Churn Rate

Only 20% of customers (2,000 individuals) churned.

Key Insights

This suggests a high level of customer satisfaction among those who stayed.

Machine Learning Approach

- **Gender Distribution:** 54% male, 46% female. This indicates a relatively balanced customer base.
- **Age Groups:** Customers aged 35-55 have the highest churn rate. This highlights a potential area for targeted retention efforts.
- **Product Holdings:** Customers with fewer products exhibit higher churn probabilities. This suggests a need to incentivize product diversification.

Ποσοστά Φύλου

Ποσοστά Εξόδου Πελατών

Πελάτες που Έμειναν vs Έφυγαν

Πελάτες ανά Χώρα (Έμειναν vs Έφυγαν)

Υπόλοιπο Λογαριασμού ανά Χώρα

Correlation Matrix of Numeric Variables

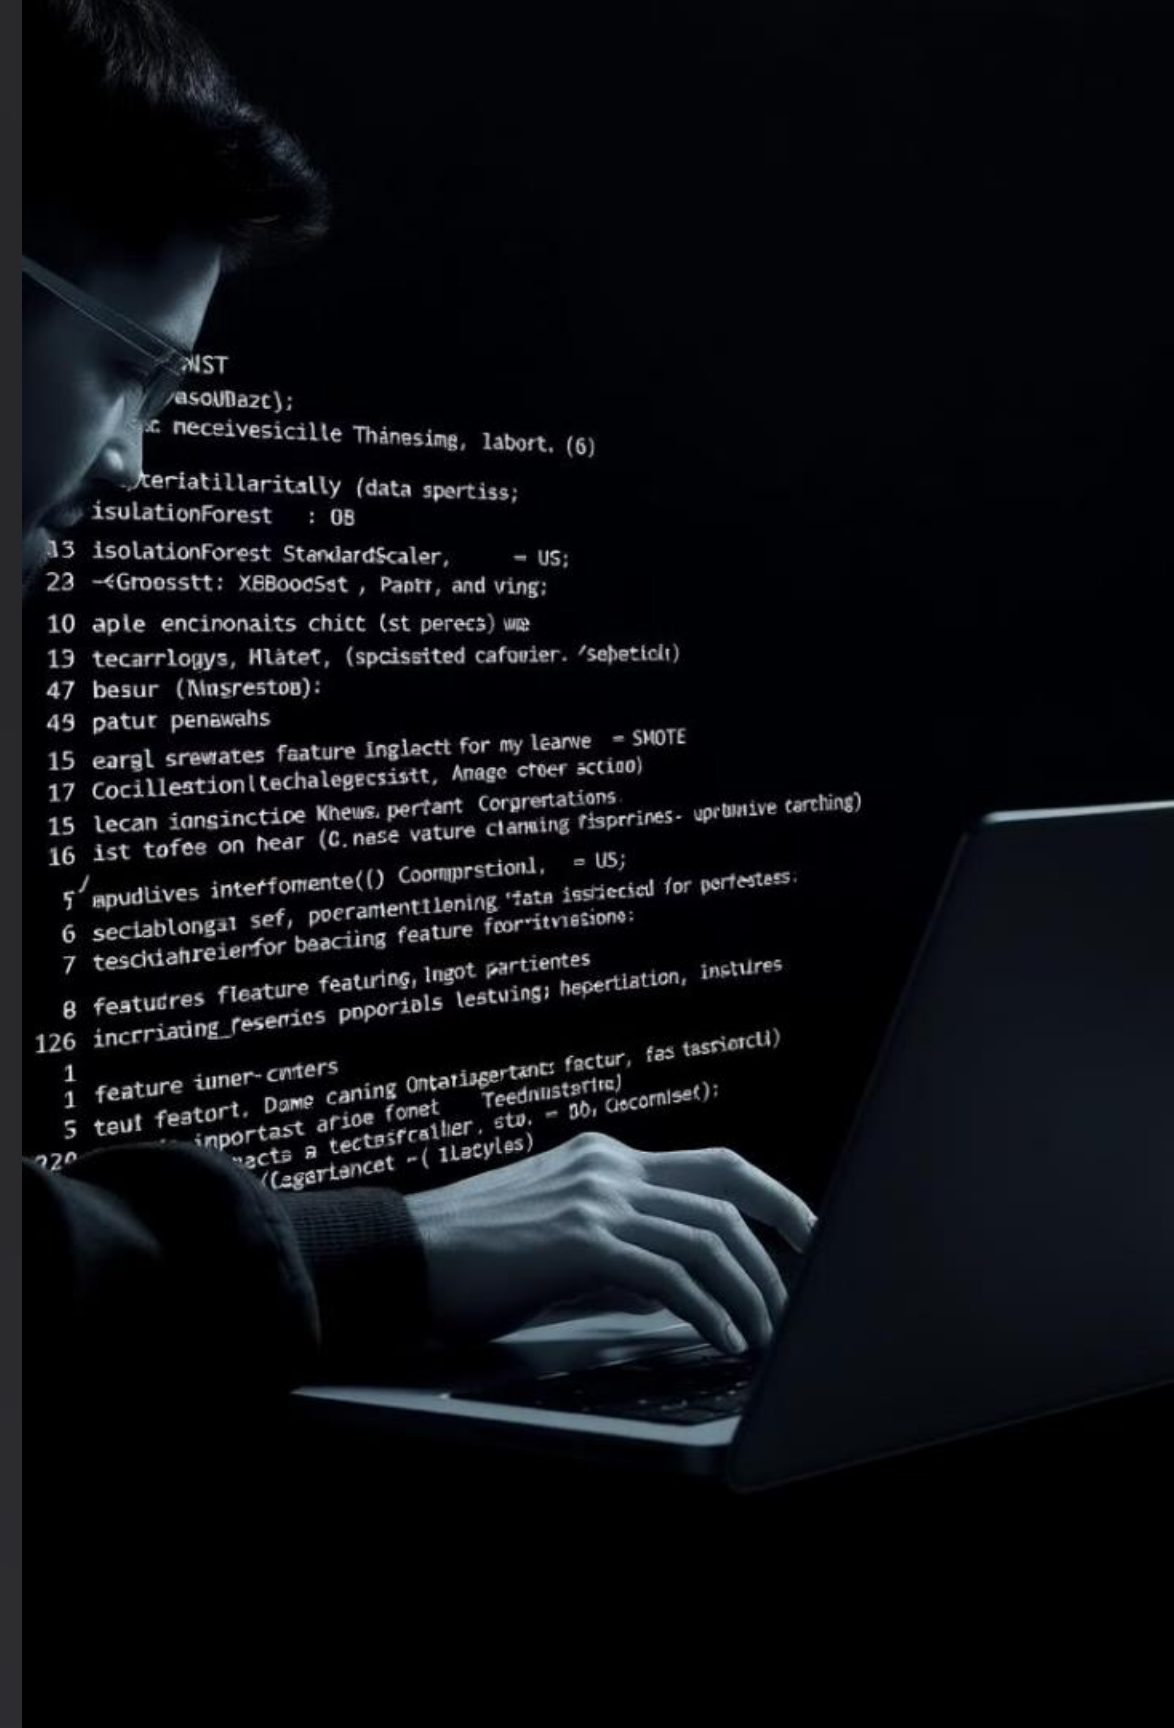

Ποσοστά Πελατών ανά Αριθμό Προϊόντων και Κατάσταση Εξόδου

Machine Learning Approach

- 1 Data preprocessing: Removed outliers using IsolationForest, scaled numeric features with StandardScaler, encoded categorical data via one-hot encoding, and selected the top 10 important features using SelectKBest.
- 2 Model training: Used an XGBoost Classifier, optimized via Grid Search, applied SMOTE to handle class imbalance, and tuned hyperparameters for best performance.
- 3 Feature explanation: Used XGBoost's built-in feature importance, permutation feature importance, and partial dependence plots (PDP) to visualize the influence of individual features on predictions.

Vasilis Katsikas

Final Deliverables

Functional Web App

Live predictions for churn probability

Trained XGBoost Model

High accuracy for churn prediction

Data-Driven Insights

Actionable intelligence for financial institutions

Feature Explanations

Churn probability and key feature explanations
